A considerable amount of research in economics and management suggests that team diversity in terms of gender, race, and background leads to greater probabilities of innovation. However, none of it links the type or degree of diversity with the multitude of innovation types. In his lecture, Professor Levitas will delve into innovation processes to examine how the interaction of diversity type (e.g., gender) with team dynamics (e.g., transformational team leadership) impacts incremental and radical innovation. Following political economist Joseph Schumpeter, he argues that innovation not least results from the recombination of technologies/resources to produce new and valuable combinations.
